## SP2504C Firmware 12

. and the 160 GB on a Samsung SpinPoint MZ-N150, but in truth, they're not far off from being one and the same. The aim of this project is to study the structure and assembly of the major histocompatibility complex (MHC) class II molecules. The emphasis is on those antigen-presenting cells which present peptide antigens to naive T cells in association with MHC class II molecules. It is proposed that the class II dimer is a multimeric molecule consisting of a dimer of the class II heavy chains associated with a dimer of the class II-related (Ii) light chains. A major goal of the project is to identify the antigens which bind the class II dimer. Another goal is to study the assembly of the class II dimer. In addition to preparing the purified class II dimer, the project is also designed to produce monoclonal antibodies to the dimer.

---

Such antibodies will be utilized in in vitro assays to identify the antigen(s) which bind the class II dimer.
