coreldraw bill book design - Free 29 Founded in the year 1990, Corel has been developing many software related to graphics and design which includes Corel Draw which is the very popular vector graphics software of Corel. It was first released in 1996. This vector graphics software is used by many design professionals and students to design logos, drawings, logos, posters, charts, graphics and much more. It is extremely easy to use as it comes with all the necessary features of designing. The best feature of Corel Draw is that it supports plug-ins and add-ons which will enhance the power of your designing even further. The field of the invention relates generally to an apparatus and method of utilizing superheated steam for treating contaminated soil and/or water and, more particularly, to a method and apparatus for treating contaminated soil and/or water, particularly heavy contaminated soil, and/or sludges utilizing superheated steam. Soil contamination can take the form of organic or inorganic materials. The most common organic contaminants in soil are organic pesticides, hydrocarbons, and other organic compounds such as polychlorinated biphenyls. Soil contamination is frequently the result of industrial accidents, leaks from underground storage tanks or fuel delivery systems, and the unintentional release of large quantities of chemicals into the soil. Inorganic contaminants can include the elements found in wastes from mining activities, chemical plants, oil refineries, gas processing plants, and any other facilities where chemicals are handled, stored, or released. The metals in these wastes include arsenic, lead, mercury, chromium, and many others. The use of steam to clean contaminated soil and/or water has been used for many years, usually at temperatures of about 100.degree. to 350.degree. F. Typically, steam has been used in single pass, batch or continuous filtration processes. The above described steam treatment processes have been largely unsuccessful because they only remove the soluble contaminants in the soil/water mixture and do not remove the contaminant permanently. Single pass or batch processes have been used to treat contaminated soil. In such processes, contaminated soil is excavated, moved to a single treatment chamber, and allowed to soak in steam for a specified period of time. Such systems are used for treating soil contaminated with organic compounds. Such processes are described in "The Use of Superheated Steam in Cleaning Contaminated Soils" by R. H. Haddad and E. A. O
