I am a Premium Member. How to. In this. I wonder how much of the V8's ability to throttle is thanks to tightly coupled engine management? I noticed during aggressive driving that gas mileage is cut in half. I have older cars with stock throttle positions that have plenty of engine throttle-ability with the gas pedal down and the AC on. They can be throttled 1/2 down to almost idle with the gas pedal and they're pretty effective in that condition. I have newer cars that kind of throttle poorly with the gas pedal down and they don't seem to want to throttle when the throttle position sensor kicks in. ~~~ nurettin The causes have been debated for years. My theory is that newer cars produce more power than they could handle. The injectors aren't sensitive enough so they end up pumping fuel into the combustion chambers when they're not supposed to. That is not a repeatable problem. The temperatures at which the injectors operate aren't high enough to cause any problems for the other components and failure modes have been seen in the exhaust side of the engine by a lot of other people. The new engines are pretty much bulletproof and have a big difficulty getting any power out of them at all. If you have a brand new car that behaves this way, try replacing the injectors. This invention relates to a two-component rapid curing catalyst-activator composition, and in particular to a two-component rapid curing catalyst-activator composition of a specific combination of a low molecular
