One component that is often used in this capacity is a disk drive array system. The disk drive array system can manage several disk drives at once. An example of a disk drive array system is the RAID.TM. family of disk drive array systems available from International Business Machines Corporation (IBM Corporation) of Armonk, New York. A RAID.TM. disk drive array system can include several enclosure ports, and each enclosure port can be connected to a memory and/or multiple disk drives. Typically, the disk drives within the disk drive array system are shared between the memory and the disk drive array system. For instance, a memory controller might access one or more disk drives when reading data or storing new data. At the same time, the disk drive array system might access one or more of the same disk drives when reading data from other disk drives and/or to store new data. The disk drive array system provides an efficient way to access data. A RAID.TM. disk drive array system may include several disk drives and a set of disk drives is often referred to as a "RAID set". There are different types of RAID sets, such as a mirrored set and a RAID set with parity. A mirrored set has copies of data in each disk in the set. A RAID set with parity includes a ba244e880a
