Nov 30, 2015 4 ways to enable remote desktop on Windows 10?. I'm setting up a remote desktop software called NetSupport Manager and it says the current settings won't give me the correct resolution. Is it possible to change the setting from desktop. This invention relates to silver halide photographic materials and, more particularly, it relates to silver halide photographic materials improved in preservability and having excellent image quality, sharpness and color reproduction. In recent years, with the spreading of the method for rapid processing of color photographs and the development of color copying technique, the amount of color prints and color paper has been remarkably increased. The advent of the practical large-size color diffusion transfer printing, the creation of many color negative films, and the development of digital color printing technique have brought about a remarkable increase in the amount of prints and color papers processed. In particular, color negative films have recently been widely used for the above-mentioned processing method. The mere development of color diffusion transfer printing technique has made it possible to make color copies from negative color films at a better resolution. On the other hand, the reduction of processing cost in development processing has been tried with the advent of processing method employing a processing solution. Although the processing solution is very effective for the cost reduction, it brings about the hindrance to the handling of the processing solution to be carried out in the processing laboratory or to the transportation or storage of the processing solution. From the above-described viewpoints, the processing solution and the method for processing in the laboratory have many disadvantages. The processing solution is therefore preferably solid for the purpose of cost reduction of processing, handling improvement, and the simplification of transportation and storage. The silver halide emulsions to be used in color print materials are required to have the sensitivity enough for the rapid processing described above, the function for increasing the processing contrast, and the color reproduction. However, the lowering of sensitivity and the silver halide grains are apt to be subject to fog due to the strong oxidizing power of the color developing solution, which leads to deterioration of sharpness and color reproduction. The fog from the silver halide grains in the emulsion layer is also a serious problem during storage of the print material after development, e.g., after being kept at a temperature of 50.degree. C. or higher in the course of developing or printing the print material. In order to solve the above problems, it is the major object of the present invention to provide a silver halide photographic material having 3ef4e8ef8d
