Chapter One: Familiarizing Yourself with the Interface By default, Photoshop uses a two-pane approach. The main window shows the image you've selected in the right side, and the tool palettes on the left side have the various tools you use. Most tools are organized into sets of icons based on the most frequently used functions of the tool. This concept is known as *\_tool palettes\_*. *\_Tool palettes\_* are areas or sections where you can access various tools, and they are conveniently placed so that you can access the most frequently used tools from a given tool palette without scrolling back and forth. In the case of the two-pane approach, you can use the right-click function to access standard tool palettes or *\_favorites\_* palettes. *\_Favorites\_* palettes are automatically created from your most frequent activities. These include presets for common tasks and keyboard shortcuts for tools. However, you can create your own tool palettes if you prefer. You can view the available palettes by going to Window → Tool Palettes and selecting the Palettes icon. To create a new tool palette, go to Window → Tool Palettes and select New from the toolbar. You can create a custom palette or select a predefined palette from the list of available palettes. Figure 1.1 shows a

Photoshop Elements lacks important features and business-specific features. Here are the top reasons why you need Photoshop instead of Elements: Free Both Photoshop and Elements are free of charge. You can either download Adobe Photoshop as a software to use or to create new images, or you can download Photoshop Elements as a software to use to edit existing images. Both Photoshop and Photoshop Elements are available for you to use or download anytime. Both Photoshop and Elements are available for you to use or download anytime. In recent years, semiconductor and other devices, or electronic components, have been increasingly microminiaturized. For example, semiconductor devices of the next generation, such as a 3rd generation (3-G) cellular phone and a cellular telephone system-Bluetooth (BT), are being microminiaturized. In this example, a semiconductor device is formed of a combination of a semiconductor substrate and a substrate adhered to the semiconductor substrate. Further, various types of semiconductor elements are also microminiaturized with a reduction in the size of the semiconductor device. However, when the microminiaturized semiconductor elements are assembled, defects are likely to be caused by external or internal stress, which can lead to deterioration in the characteristics of the semiconductor device. As a means for preventing such defects, for example, Patent Document 1 proposes a technique for improving the stress relieving property of a device under the condition of 300° C. by forming an oxide film on a surface of a base film and forming a layer having a thermal expansion coefficient in a range of 90 to 170 ppm/° C. on the base film. Further, as another means, for example, Patent Document 2 discloses a technique for improving the stress relieving property of a device under the condition of 300° C. by forming a silicon film having a thermal expansion coefficient of 11 to 70 ppm/° C. on a side of a device surface. Furthermore, as a further means, for example, Patent Document 3 discloses a technique for reducing stress generated by a heating process on a bonding interface. In Patent Document 1, the thermal expansion coefficient of the device surface is reduced to

improve the stress relieving property of the device surface. However, the reduction in the thermal expansion coefficient of the device surface makes it difficult to implement the electric connection to a silicon substrate and a SOI substrate. In Patent Document 2, the silicon film having a thermal expansion coefficient of 11 to 70 ppm/° C. is formed on the device surface. However, the thermal expansion coefficient of the silicon film is at least 50 ppm/° C. as in usual silicon films, and the degree of reduction in the thermal expansion coefficient is not sufficient. Furthermore, the silicon film having a thermal expansion coefficient of 50 ppm/° C. has a coefficient of thermal expansion of 90 to 170 ppm/° C. However, the coefficient of thermal expansion of such a silicon film is not much different from the coefficient of thermal expansion of

1. Field of the Invention The present invention relates to a window blind assembly for use in an architectural opening, such as a window or door, a track rail to which the blind assembly is attached and a conduit for receiving a roller blind. More specifically, this invention relates to a single mullion assembly including a stationary rail and a movable rail attached to the movable rail. The invention further relates to a conduit which accepts a roller blind without the need for the use of a pulley. 2. Description of the Background Art In the context of the present invention, the terms window blind assembly are not limited to those types of assemblies having a mechanism for raising and lowering the slats of a roller blind. These types of window blind assemblies are well known in the art and are generally used for

---

aesthetic reasons. The present invention incorporates a stationary rail and a movable rail which are configured for attachment to existing architectural opening panels, such as doors and windows, a track rail that includes a channel through which a channel roller of a roller blind will pass, and a conduit that will accept a roller blind. The stationary rail is fixed to an architectural opening panel and a movable rail is slidably attached to the stationary rail. The movable rail is attached to the movable rail at a point closest to a bottom of the movable rail. The principal objects and advantages of the invention will be apparent to those skilled in the art upon examining the accompanying drawings and upon reading the following description of the invention.

Q: what does `.*` in bash mean I am currently reading bash's source code, I found some code like: `for dir in $base_dirs.*; do ^` I have no idea what `.*` means here.

A: `.` denotes a regular expression that matches zero or more characters. The backslash escapes the regular expression special characters, so it can be interpreted literally. `.*` means "any character, any number of times" The development of a web-based version of the computerized cognitive assessment of memory functioning tool.
