(How to install: Click on the link, download and run the provided installer.)Q: Origin of the transitive property of a relation I think the definition of the transitive property of a relation is something like: "if x is related to y , and y is related to z , then x is related to z ". But why is this property transitive? Why is it not true: "If x is related to y , y is related to z , and z is related to x , then x is related to z "? A: The usual explanation is that for any two elements of a set, there is a unique element they are related to, so it really is just a matter of replacing "is" with "is related to". A: The problem with the explanation of @Derek Elkins is that the proof is by contradiction. And as you yourself pointed out in your question, this is a very unsatisfactory way of proving things. The definition in the abstract algebra book is the "strongest" or "intuitive" definition. Not provable for the mathematicians. But yes, it's really just a matter of replacing every relation with its inverse to obtain the 'weakest' definition in terms of set properties. In terms of set properties, the transitive closure (transitive closure of a relation is the weakest transitive closure) is precisely the relation that is actually used for the definition. A: I like to do it this way. We want to be sure that, for any two elements x, y , we have a z such that $x R z$ and $z R y$. So, let's do this. Take x and y and see if
