ethnopharmacological relevance: *berberis aquifolium* lindl. (syn.: *berberis vulgaris* l., *b. aquifolium* lindl., family: berberidaceae) is used in traditional medicine systems in south, southeast and east asia as an anti-inflammatory, diuretic, antitussive and also for the treatment of asthma and bronchitis. ethnopharmacological relevance: ginger (*zingiber officinale* roscoe) is one of the most widely used culinary herbs. it has been used in folk medicine systems in many countries for the treatment of fever, cough and cold, stomach ache, insomnia, and respiratory disorders.

ethnopharmacological relevance: *glycyrrhiza glabra* l. (syn.: *g. uralensis* l., family: leguminosae) is the source of the product glycyrrhizin, a bioactive saponin that has been used in traditional medicine systems in asia for the treatment of diabetes. it is used for the treatment of diabetes in various ayurvedic formulations.

ethnopharmacological relevance: *indigofera tinctoria* l. (syn.: *i. prostrata* wall., family: fabaceae) is an annual herb found in the dry zone of pakistan. the plant is used in traditional medicine systems in southeast asia for the treatment of snake bite, edema and asthma.

riwaq is a midwife (qariyah) who is actually qualified to be a doctor and has been treating women for over twenty-five years. riwaq assists women in very early stages of pregnancy. she counsels them on the best time to conceive, choice of a father and the safest method of delivery. in the pakistani context, this is a highly specialized field where midwives are seldom available. it was in this context that riwaq came up with the idea to provide free training for qariyah, a traditional birth attendant, to enable them to provide primary health care services to pregnant women.

Qarshi Medicine In Urdu Pdf Free

The results of our review of Chinese herbal prescriptions for dementia have been published previously [100]. Chinese herbal medicine prescriptions contain, on average, 1.3 herbs per prescription with the majority containing 2 herbs, 4 herbs and 4 herbs [100] (Figure 3). Moreover, herbal medicines were prescribed as monotherapy in 57.1% of cases, in combination with another herbal medicine in 22.8% of cases and in combination with a western medicinal product in 20.2% of cases. Chinese herbal medicine prescriptions are, in general, prescribed for the treatment of mild to moderate dementia symptoms such as cognitive dysfunction, delirium, etc., or for the treatment of VaD symptoms such as behavioural or psychological symptoms or depression symptoms. In this review, most of the studies that have investigated the therapeutic effects of Chinese herbal medicine in dementia or VaD have used herbal monotherapy with an unclear rationale for the selection of the herb. Interestingly, the results of our previous review indicate that herbal medicines are a common part of dementia care in China with the majority of prescribed medicines consisting of acupuncture and Chinese herbal medicine. It is noteworthy that pharmacological mechanisms of Chinese herbal medicines have not been studied systematically and thus it is difficult to comment on their therapeutic potential. The mechanism of action of traditional Chinese medicines (TCMs) is often in need of clarification. In this study, a new antifatigue decoction, Danggui Sini decoction (DSD), was developed based on the theory of TCMs. It was composed of 7 herbs. The effects of DSD on cerebral fatigue and learning and memory, as well as the mechanism involved, were investigated. The results showed that DSD could significantly improve the hemodynamics, prolong the reaction time and reduce the rotating number in a rotating rod test. It also improved the acquisition of learning and memory, and maintained the improvements in 14 days' duration. The mechanism research suggested that DSD protected cholinergic, noradrenergic and serotonergic systems, reduced lipid peroxidation and oxidative damage, and improved the level of endothelial nitric oxide synthase in the brain. 5ec8ef588b
